

Attestation of AI Model Use – EVE™ Retrospective Risk Model

Date: [Insert Date]

Purpose

This document affirms that Reveleer’s Evidence Validation Engine (EVE™) is a supervised, predictive AI model. It does not generate or synthesize new content with generative AI. EVE is designed to assist certified medical coders by identifying potential diagnoses along with supporting documentation. It does not replace the coder’s role or clinical judgment.

Technology & Oversight Summary

Component	Details
AI Category	Predictive only. No generative AI used.
Model Type	Supervised machine learning trained on labeled historical claims data.
Coder Integration	Supports certified coders by surfacing possible HCCs and MEAT/TAMPER evidence. Final decisions are human-led.
NLP Methods	Uses LLM-enhanced and traditional NLP for document parsing and evidence identification.
Monitoring	Monthly quality reviews. Outlier confidence scores trigger investigation and model refinement.
Update Cadence	Refreshed at least twice annually through controlled software release cycles.
Auditability & Compliance	HIPAA and SOC 2 compliant. All outputs are traceable to original documentation for RADV audit support.

Key Assertions

- i. **Model Type:** EVE is a supervised model using predictive, not generative, AI.
- ii. **Assistive Role:** EVE assists coders by identifying diagnoses and supporting evidence (MEAT/TAMPER).
- iii. **Human Oversight:** Certified coders retain full control and make all final decisions.
- iv. **Traceability:** All model outputs are sourced from and traceable to clinical documentation.
- v. **Monitoring:** EVE undergoes routine monitoring and is regularly updated.
